MSS Strong Authentication Services

FEATURES:

- _ Two factor authentication
- _ Two physical locations
- _ Monthly usage reports
- _ Minimum 99.5% service availability
- _ Secure repository of all users identification forms

BENEFITS:

- _ Ensured authentication of users reducing risk
- _ Confidence in authentication of individuals accessing IT system
- _ 24x7 operations and technical support
- _ Enforcement of security policies
- _ External management of tokens inventory

CGI MANAGED SECURITY SERVICES – STRONG AUTHENTICATION SERVICE

As a leading and fully functional managed security services provider (MSSP), CGI offers a breadth of service options that are customized to meet your unique business requirements. We call this our building block methodology—adapting and customizing our managed security service lines to best meet your security objectives.

CGI's CGI MSS Strong Authentication service allows companies and government agencies to outsource a full service authentication service using a security technology known as "two factor authentication". To authenticate, a user must have a physical device or token (something you have) and a Personal Identity Number (something you know).

Strong authentication ensures that only the right persons can access client IT assets. In addition, the service helps the client establish security policies for who is authorized to access what technologies. It assists clients in reducing the risks to an organization by simplifying vulnerability management activities, and enables processes for compliance to government and industry/regulator security standards.

The technology supporting the authentication service is replicated across two diverse physical locations enabling a high level of service availability to be delivered to the client. Available to assist clients is a 24 hour 365 day a year Service Desk for those who have forgotten their Personal Identify Number or have inadvertently disabled their access by entering incorrect access codes. A monthly summary report of a client's security authentication events (both successes and failures) is provided via a Web based portal.

As an integral part of the CGI Managed Security Services Security Operations Center (CGI MSS SOC), the CGI Computer Incident Response Team (CGI CIRT) provides 24x7 IDS services and support that includes monitoring network traffic and anomalous activity right down to the packet level.
